No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                           1372.8

                                                                                                                                                                                              defined as the Fas gene promoter region. This includes a number of transcription factor binding sites. A coding sequence for the N-terminal portion (AAR99471) of the Fas protein leader peptide is also included. The DNA segment was isolated from a human ras cDNA placental DNA library using a 32P-labeled segment of human ras cDNA corresponding to nt 23-346. It can be combined with a structural gene so that the gene is under the transcriptional control of the transcription factor binding sites. The promoter region can be used to regulate Fas gene expression, e.g. in tumour or immune cells, as a means of treating Fas-mediated apoptosis disorders such as
                                                                                                                                                          Sequence 1608 BP; 398 A; 421 C; 423 G; 366 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WO200200928-A2
                                                     The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, AIDS, epilepsy, heurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/vlacerative bowel diseases. The present sequence is a gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        01-SEP-2000; 2000DE-1043826.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ş
The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders,
                                                                                                                                                                                                                        Nucleic acid comprising fragment of chemically modified gene, useful for diagnosis and treatment of diseases associated with abnormal

The p53-binding region, or a vector containing it, can be used to screen for apoptosis-modulating substances potentially useful for cancer chemotherapy. This sequence represents a fragment of the human CD95 receptor intron 1 which contains a p53 binding region described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 266 BP; 49 A; 72 C; 110 G; 35 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence encodes human Fas (Apo-1). The specification describes antisense compounds which are targeted to the 5'-untranslated or 3'-untranslated region of nucleic acid molecules encoding Fas, Fas plusphatase). The antisense compounds are used to inhibit the expression of Fas, FasL or Fap-1 in cells or tissues. They are used to treat autoimmune or inflammatory diseases such as hepatitis. They are not also be used to treat cancer, especially colon, liver or lung
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 2551 BP; 826 A; 493 C; 508 G; 724 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      mRNA was obtd. from human lymphocytes and PCR was used to make cDNA specific for Fas-delta-TM (i.e. Fas lacking the transmembrane region) mRNA. The PCR product was ligated into pBluescript and the recombinant plasmid was used to transfect E. coli pH5-alpha cells. insert sequence of pBluescript-Fas-delta-TM is given in AAQ93879.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       constrophil cells. The method can be practised in vitro, ex vivo or in vivo. Suitable immunosuppressive agents include antisense molecules that inhibit endogenous fast expression, soluble Fass receptors, ribozymes that inhibit the endogenous expression of cast, drugs that inhibit fast signalling, agents that induce the candogenous expression of transforming growth factor (TGF)-beta, and polynucleotides coding for an immunosuppressive agent such as and polynucleotides coding for an immunosuppressive agent such as card polynucleotides coding for an immunosuppressive agent such as and polynucleotides coding for an immunosuppressive agent such as card to the method can be used for treating disease associated with an undesired Fast-mediated proinflammatory response, e.g. cystemic lupus erythematosus, rheumatoid arthritis and psoriasis. The invention also provides a method for identifying agents which are mediated stimulation of a proinflammatory response.
                                                                                                                                                                                                                                                                                                                                                                                                                   QΥ

The invention provides a method for inhibiting a proinflammatory response in a cell mixture by administering an immunosuppressive agent which inhibits the proinflammatory activity of Fas ligand (Fasl). In some embodiments, Fasl is coadministered of Fas ligand (Fasl).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Disclosure; Fig 4B; 71pp; English.

                                                                                                                                                                                                                                                                                                           A cDNA library was prepared from polyA+ RNA from the human lymphoma cell line KT-3. The CDNA was ligated to BstXI-cut vector pCEV4 via BstXI linkers. The KT3 cDNA library was used to transfect monkey COS-Ab. The cells were then suspended in buffer containing murine anti-Fas antibodies. The Fas-expressing cells adhered to the plates. Extrachromosomal DNA was prepared from adhered cells and used to positive clone (pF3) was used to screen the KT-3 cDNA library. The longest cDNA clone was designated pF58 and contains an ORF corresp. (i.e. human Fas antigen)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     mat_peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            03-MAR-1995;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WO9601277-A1.
                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents the coding sequence for the human Fas antigen contained within the plasmid pCEV4/hFas. The soluble Fas antigen is included in the immunoassay kit of the invention. The kit is for the assay of soluble Fas antigen and contains an immobilised anti-soluble Fas antigen encoded monoclonal antibody, as well as the standard soluble Fas antigen encoded by this sequence. The assay is simple and has high accuracy, high by this sequence of assaying a number of different specimens sensitivity, and is capable of assaying a number of different specimens at the same time. The immunoassay is used on biological samples (such as serum) and is useful for diagnosis of autoimmune diseases such as rheumatoid arthritis or systemic lupus erythematosus (SLE).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (MEDI-) MEDICAL & BIOLOGICAL LAB CO LTD.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                "Fas protein"
```

The present sequence represents a Fas cDNA sequence used in the CC method of the invention. The method is concerned with reducing CC depletion of activated Fas-expressing CD8+ T-lymphocyte killer (TK) CC cells in an immune cell population which also comprises of Fas-ligand CC (Fasi)-expressing activated CD4+ cells. It involves contacting this CC (Fasi)-expressing activated CD4+ cells. It involves contacting this CC (Fasi)-expressing activated CD4+ cells. It involves contacting this CC (Fasi)-expressing contaction with an effective amount of an agent (e.g. a CC interaction between Fas and Fasi. Therefore, the method is useful for CC interaction between Fas and Fasi. Therefore, the method is useful for CC interaction to the agent in the manufacture of the apentic compositions. CC res-expressing CD8+ TK cells in immune cell populations. Also claimed CC is the use of the agent in the manufacture of therapeutic compositions. CC cell surface receptor Fas and its ligand Fasi. By interfering with CC cell surface receptor Fas and its ligand Fasi. By interfering with CC cell surface receptor Fas and its ligand Fasi. By interfering with CC apoptosis of CD8+ TK lymphocytes caused by expression of Fasi on CC apoptosis of CD8+ TK lymphocytes caused by expression of Fasi are activated CD4+ cells. Such Fasi-expressing activated CD4+ cells are extivated CD4+ cells. Such Fasi-expressing activated CD4+ cells are virus e.g. human immunodeficiency virus (HTV) or simian immunodeficiency virus e.g. human immunodeficiency virus (HTV) or simian immunodeficiency virus e.g. human immunodeficiency virus (HTV) activity continued to composition of apoptosis may then allow continued to composition of apoptosis and the cD4+ cells infection with the infectious agent, enabling continued to composition of activate continued to composition continued to composition of continued to continued to continue diseases e.g. AIDS.

```
The present sequence was used in the development of novel Fas antigen derivatives, which contain a Fas antigen extracellular region lacking one or more amino acid residues in the region from the amino-terminal to (but excluding) the 1st cysteine residue (preferably at least 29 residues are deleted).

The derivatives are effective regulators of apoptosis and can be of the coding DNA in gene therapy) to treat a range of diseases, such as hepatits, influenza and HIV, by modulating apoptosis of virus-infected calls
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        멍

                                cis elements needed for replication and virion encapsidation but is deleted of all viral genes. It carries a mouse dystrophin virus that supplies the sequences needed for a productive viral adenovirus is produced that is characterized by high titer transgene transgene into the host cell chromosome. Such a vector can be used to transfer the dystrophin gene for use in muscular dystrophy gene

It carries a CFTR gene under the control of a chimeric CMV enhancer/Chicken beta-actin promoter. It is used with a helper virus that supplies the sequences needed for a productive viral infection but which has disabled packaging function. A productive viral infection but which has disabled packaging function a productive viral is produced that is characterized by high titer transgene delivery to host cells and the ability to stably integrate the transgene into the host cell chromosome. Such a vector can be used to transfer the CFTR gene for use in cystic fibrosis gene therapy.
